### NEW MUSICAL INSTRUMENT.

Sound Produced by Electrical Vibrations in "Telharmonium."

zNew York, Nov. 10.—Dr. Theddeus Cahill's invention for producing music by electrical vibrations, as one would telephone, called the "Telharmonium" was exhibited last night at the Cafe Martin. To produce the vibrations a set of elaborate machinery and electrical appliances have been installed. There is a set of 145 alternating current dynamos which make vibrations varying from sixteen to eight thousand a second. These currents are passed through "Tone Mixers" and are released by a keyboard not unlike the key board of a pipe organ. The keyboard is played by a musician, and the electric currents give the vibrations required to produce the music desired. At present there are two keyboards which represent a flute and a horn. Two more are to be put in at once, and the effect will be that of more instruments played together. The music can be transmitted through a telephone.
